23

CRITICAL

Check Results

Check	Score	Progress	Status
Robots.txt	0/18		☐
llms.txt	0/18		☐
Schema JSON-LD	0/16		☐
Meta Tags	8/14		☐
Content Quality	10/12		☐
Signals	2/6		☐
AI Discovery	0/6		☐
Brand & Entity	3/10		☐

Recommendations

1. Create robots.txt with Allow rules for AI bots (GPTBot, ClaudeBot, PerplexityBot)
2. Create /llms.txt for AI indexing: `geo llms --base-url https://yorko.github.io`. Note: llms.txt is an organizational signal, not a proven ranking factor. It helps structure content for AI systems.
3. Add WebSite JSON-LD schema to homepage
4. Add FAQPage schema with site FAQs

5. Add Organization JSON-LD schema with name, url, and logo
6. Add optimized meta description (150-160 characters)
7. Add Open Graph tags (og:title, og:description, og:image) for AI and social previews
8. Add H2/H3 subheadings to structure content for AI extraction
9. Add lang attribute to <html> tag (e.g., lang="en") for AI language detection
10. Create /.well-known/ai.txt to define AI crawler permissions
11. Create /ai/summary.json with site name and description for AI engines
12. Create /ai/faq.json with structured FAQ for AI search visibility
13. Create /ai/service.json to describe service capabilities for AI
14. Add sameAs links in Organization schema to Wikipedia, Wikidata, LinkedIn, or Crunchbase for Knowledge Graph disambiguation
15. Add address, telephone or contactPoint to Organization schema for entity validation
16. Add potentialAction (SearchAction) to WebSite schema for AI agent discoverability
17. Add descriptive labels to forms (label, aria-label) to make them usable by AI agents
18. Consider adding WebMCP toolname/tooldescription attributes to interactive elements for Chrome AI agent support
19. High boilerplate ratio (98%) — use <main> tag to help AI extract core content
